The Technology Dance - It Takes Two

Master Hilarion

Now with good reason, humanity has come to expect that technology is a salvation, that something will come along, some invention, some discovery, some modification of an existing technology. It will all come along and problems that have been plaguing the human family for some time will overnight and magically be resolved.

And this is the way things have been working so far. With many technologies, however, the implementation has been lopsided or flawed. Those are two different characteristics, lopsided meaning only the very few can own the technologies, have them, use them and they are not benefiting the whole of the human family. They benefit only certain countries, certain people with the right infrastructure or the right amount of money in order to be able to pay for the right infrastructure to support this technology.

The second flaw is inappropriate exploitation, inappropriate or flawed adaptation. Something that is intended to be, let us say a component of a medical breakthrough in diagnostic techniques becomes instead a military weapon. Or a breakthrough discovery is turned to military defense and perhaps, at some point in the future, the use in medical diagnostics is discovered, but it might be that this discovery comes at the cost of war.

Technology that is developed and exploited as a result of war is not part of the plan for the human family.

And what do I mean by “exploited as a result of war?” Well clearly, there are the upfront munitions or destructive powers that technology can offer. That, quite frankly, is horrifying to those of us who see quite different uses for technology.

The other aspect is the technology that is developed to aid those human beings who have been – well, I am tempted to use the word “injured” but injured does not cover it – who have been torn apart in some way because there was a war. They were either participants from the military or innocent civilians.

Some technology spreads appropriately, but not enough that we can do business as usual.

Now, what does technology have to do with the advancement of consciousness for the human family on Earth? I'm sure there are plenty of answers rolling off your mind. I hope that at least one of them is the acknowledgment that technology can be a partner in creating an environment where every human being has adequate food because food production *and distribution* is aided by appropriate technology. And this environment is such that water, potable water is available to every human being on this planet in adequate supply. I hope that is on your list. And I hope that on your list is climatic adjustment, which is a very fancy way of saying heat and cooling as needed and appropriate to live in harmony with Mother Earth.

Now, what institutions are going to be affected if technology as I have described it comes to be common, ordinary technology application on this planet?

I think you'll realize that the military-industrial complex is going to suffer significantly. Why? Because their products will no longer be needed. And what will happen then? Well, the clever ones will try to find another means of exploiting, another means of keeping their power.

Who else in the world of industry is going to either change or suffer? Well, the fossil-fuel industry is sure to be hit hard. And what does that mean? Well that certainly means less exploitation of Mother Earth.

Turn that around and take a more positive view. What industries are going to bloom?

Distribution networks – I will repeat that: distribution networks. Food does no good if it cannot be properly distributed to those for whom it is indeed considered to be food. Any of you who have traveled and eaten local cuisine in a great many different countries will understand what I mean when I say "something that is considered to be appropriate food." No food is of any value if it cannot be distributed effectively to those who are in hunger.

And I would say the same can be said for any medical treatment that is available, any medical applications – equipment, products, consumable medical supplies. Without distribution, these are not getting where they are needed.

Research. Research is the other area. Researchers will be asking the right

questions only when their consciousness has been raised to a much broader view of the human vehicle of manifestation, i.e. the full complement of energies that compose the human body – energies that go beyond the dense physical, energies that connect one human being with another. Unless the right questions are asked, the right research will not begin.

And if the right questions *are* asked and the research does begin, just as research began to develop military weapons, just as research began to try and repair those human beings who were torn apart by war, the right questions will be asked to explore the spiritual aspects of human beings. The technology will then be requested in the minds of scientists and technicians. And when the right questions are asked and there is a good prospect of proper use, then technology can be made available.

So you see, there is a dance, an intricate dance that takes place between humanity's level of consciousness and technology- its release, implementation, application and modification. And this dance must be based on the good of the whole, on the Oneness of the human family, on the compassion, on the love, on the realization that indeed what happens to a four-year-old child halfway around the world does impact what happens in your own neighborhood, in your own family.

What happens to a mother, a father, a grandparent halfway around the world impacts you because members of the human family of Earth are inextricably connected energetically.

That may be very difficult to prove now, but you see, researchers are not yet asking the right questions. And even when they start asking the right questions, it must be certain that the technology to aid that investigation will not and cannot be turned against any human being or any other living organism, including Mother Earth herself. There is a dance. That dance is raised consciousness.

It is very difficult to find a suitable analogy that will explain the shock that can reverberate when the extent to which every human being is energetically connected to every other human being becomes reality. When that concept sinks in and becomes part of the way you look at the world, the way you look at every human being you see in the most crowded place you can imagine, the way you imagine every human being you hear about through your various media, the full realization can create a very deep shock.

As you recover from that deep shock and integrate into your worldview what Oneness really means, then you, personally, are helping to raise the

consciousness of the human family on Earth. So I would invite you to consider the fact that you are connected to every other living being. Consider this as you meditate, as you find nothing to think about when you exercise in the gym or as you are going for a long walk. Think about the human family's energetic connections the next time you go out into the world shopping, looking for food, meeting friends.

You, personally, can be part of raising the consciousness of the entire human family because this consciousness is raised one person at a time. It cannot happen in any other way. And when consciousness is sufficiently raised in the human family, then it will be possible to acquire and use properly technologies that are, quite frankly, available to be released.

You, personally, can help make that release of technologies possible because you make an effort to raise your consciousness and begin to live and function on the basis of Oneness.

I thank you.
